Windows software downloads are a mess. Many programs try to drag adware and other malicious junk to your computer. Even the safer programs we test sometimes turn to the dark side and later start bundling junk. More experienced geeks may not often fall for this stuff as well, but we have all sorts of readers here. We prefer to avoid placing our readers in situations where they might be infected because they have downloaded something that we recommended. Change software downloads here the worst thing we have to deal with. We regularly test the software and find that it is clean and works well, so we recommend it to our readers. We have done all our hard work -everything is fine. But applications are often sold to new owners, or the current owner gets desperate for income. These formerly trusted applications add adware, browser toolbars, spyware and other junk to their installer. New readers download these tools because we recommended them, and then start receiving us emails about why we're recommending software that infects our readers' computers. It's impossible to police and regularly check all the software we link, and we don't want a large collection of articles linking to framework software that can hurt our readers. If an application is not completely trustworthy and has a different way of doing something, we would probably recommend that way. This should not apply to more trustworthy software, but it sometimes does. We regularly recommend software such as Firefox, Chrome, LibreOffice, Seacleaner, VLC and other popular applications. However, we have also recommended popular applications like Foxit Reader and µTorrent and seen them changing on the dark side. Lesser-known utilities are even more suspicious. Junkware-filled installers are completely normal in adware, toolbars and other junk Windows software view in installers. This is also true for installed, legitimate software. Oracle's Java Runtime Ask toolbar tries to install. µTorrent is a popular BitTorrent client, but have you tried to download it recently? You'll need to click through various offers that try to install groove search adware and a scammy PC cleaner on your computer. This junk has been marked as recommended by BitTorrent, so less experienced users think it's actually recommended software, not that they're being paid to recommend junk they'll never use themselves. Related: The Shameful Saga of Uninstalling The Horrible Ask Toolbar We've tried to avoid this in the past by including warnings in the article. We want to write something like be careful when installing this software, as it will try to install junk on your computer. Be sure to reject the offer. But not all readers take on that warning. Some readers may see the warning and agree by mistake as they click through the installation wizard - it's to give you a trick, after all. Ask Toolbar also attempts to hide before installing itself, so you can't instantly if you agree by mistake, this. You'll have to wait later - ask hoping you'll forget to do so. Yes, we have built an immunity to this type of junk by Windows Geeks. Many of us don't even care — we just carefully click through the installer and consider it normal. But many people still fall for this trap. Fake download link related: How to avoid installing junk programs when downloading free software Fake download links are particularly unpleasant. You go to a program's download page and see five different download buttons. Which is the real download button, and what exactly are the ads that will take you from the actual software to something that will harm your computer? Of course, there are tricks you can use here. You can mouse over a link and see where it goes. If you download the software for a long time, you'll take a kind of sixth sense and realize which fake download links are and which aren't. But these links trick people. We are not thrilled about other software downloads to push these sites, either. For example, let's go back to µTorrent again. When you download µTorrent, you download VLC Media Player. This seems like a great recommendation- VLC is a very good media player. This link will not take you to VLC's official download page; This takes you to a third party download site. Who knows this second site is wrapping up VLC - if you install it you'll probably get infected with some kind of junk. If they're paying for these ads, they're making money somehow from these downloads. To add insult to injury, µTorrent really warns you to beware of online scams! When you install it. This warning says that you should only download µTorrent from your official site because you may be infected with malware if you download µTorrent from an unauthorized site. Yet they are recommended you download VLC from a shady third party site! We're not recommending our readers ditch all their Windows PCs, but we're trying to be extra careful about what we recommend.
